- **System Overview:**

The Andok's Food Delivery System is an online ordering and delivery platform tailored for a local restaurant business. It allows customers to browse menus, add items to their cart, provide delivery details, and choose between delivery or pickup options at checkout. This system offers a seamless experience for customers by streamlining food ordering from selection to completion.

On the backend, riders can log in to view their assigned orders, check detailed order information, track the customer's delivery address, and upload proof of delivery to confirm the completion of each delivery.

Admins and riders each have their own personalized dashboards. Admins can monitor overall system activity, manage orders, customer data, and track restaurant performance. Riders can view order history, track their performance, and manage their deliveries in real time. This ensures a well-coordinated system for efficient operations and high customer satisfaction.

- **Business Problem:**

Based on recent consumer trend studies from sources like Statista and Grab, there is a growing preference for online food ordering in the Philippines. Factors such as convenience, speed, and the comfort of eating at home continue to influence customer behavior, especially in areas like Nasugbu where dine-in options may be limited. While other Andok's branches have adapted by offering delivery services through third-party platforms, the Nasugbu branch currently lacks its own dedicated system.

This gap creates inconvenience for local customers who wish to enjoy Andok's meals from the comfort of their homes but have no access to delivery options. To address this, a custom food ordering and delivery platform was developed for the Nasugbu branch which improves customer satisfaction and streamlines order and delivery management for the business.

- **Introduction**

Andok's is a well-loved Filipino food chain known for its iconic liempo, litson manok, and other traditional dishes. Since 1985, it has grown from a small rotisserie stall into a nationwide brand, offering authentic flavors and value to Filipino families.

Despite its popularity, the Nasugbu branch does not offer delivery services like other franchises, leading to missed opportunities and customer dissatisfaction. This project aims to solve that gap by developing a custom food ordering and delivery system tailored to the branch's needs, enhancing efficiency and providing a more convenient experience for customers.

College of Informatics and Computing Sciences

- **Objectives**

- To develop a user-friendly online food ordering system
- To allow admins to manage orders, customers, and product availability
- To generate real-time reports for business insights
- To enhance customer experience through timely service
- To automate the tracking and management of food deliveries

- **Data Sources and Preparation**

College of Informatics and Computing Sciences

- Data preparation
 - **Cleaning:** Remove duplicate records and ensure data accuracy by applying validation rules.
 - **Aggregation:** Calculated total number of orders and overall revenue using basic totals and grouping.
 - **Joining Data:** Linked information from users, orders, and deliveries using inner joins.
 - **Views:** Created simplified views to display revenue, rider earnings, order summaries, and store performance.
 - **Stored Procedures:** Used for repeated tasks like getting user info and sending notifications.
 - **CRUD Operations:** Built functions to add, edit, delete, and view users, products, and orders.
 - **Events:** Set up automatic actions like cleaning old logs and sending product alerts.
 - **Triggers:** Recorded all changes to orders and database updates in a separate audit log.
 - **Audit Trails:** Kept records of all actions by admins, riders, and customers for transparency and tracking.
- **Screenshots**
 - Startup Window-** This is the initial screen displaying the business logo, signature meals, and a brief description of the restaurant. Buttons like Order Now, Add to Cart, and View Menu will lead the user to the login window.

- **Login and Signup Window (Role-Based Access)-** This window handles both login and account registration. Depending on the user role (Admin, Rider, or Customer), logging in redirects them to the appropriate dashboard. Signup requires agreement to the Terms and Conditions. All passwords are securely hashed in the database using SHA-256.

- **Store Closed Window -** If a customer logs in while the store is closed or hasn't been opened yet, this window is displayed to inform them.

College of Informatics and Computing Sciences

- Admin Order Management

Gcash – Admins can approve or decline payment (declining cancels the order).

Pickup – Admin marks the order as ready and later as picked up.

Delivery – Admin assigns orders to available riders and views their current workloads.

College of Informatics and Computing Sciences

- **Ratings Window** – After receiving their orders, customers can rate their experience.

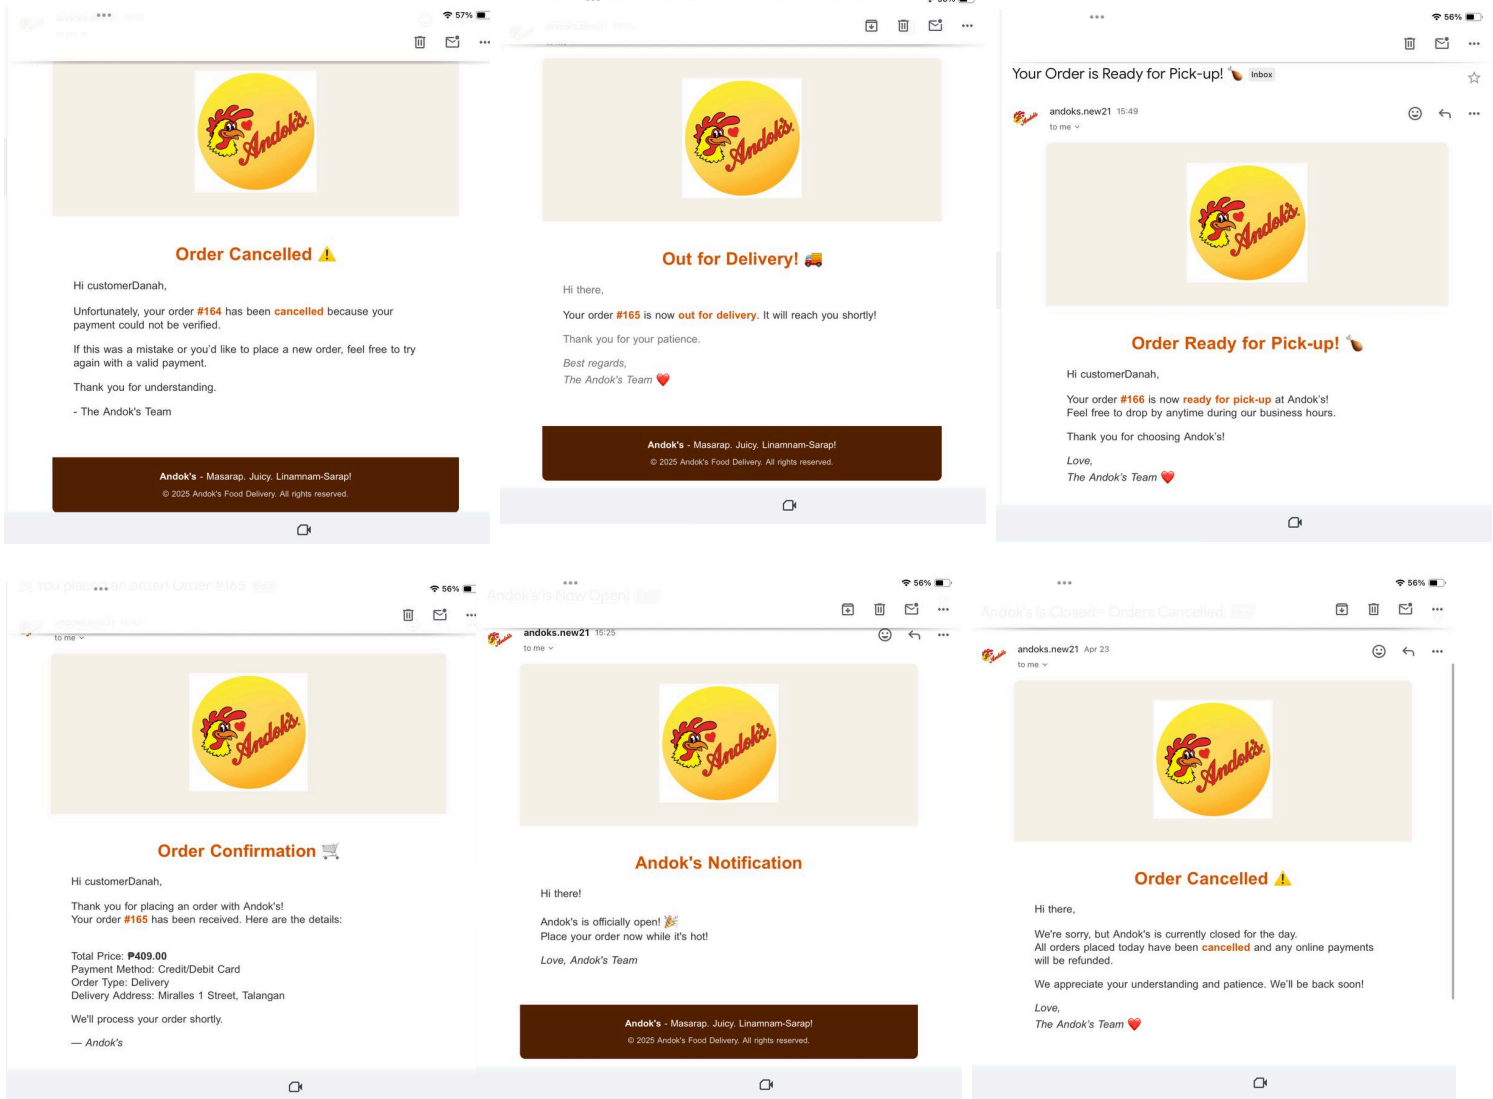

- **Notifications System**

Notifications appear both in-app and via email, depending on events such as order confirmations, status changes, and store openings/closings.

Leading Innovations, Transforming Lives, Building the Nation

College of Informatics and Computing Sciences

- **Report Generation**
Admins can generate printable or PDF reports detailing store performance for the day — including total earnings, customer counts, best-selling items, and rider statistics.

165	7	409.00	Credit/Debit	Completed	2025-04-24 15:45:02.0

College of Informatics and Computing Sciences

- **Insights**

In today's digital age, where speed, accuracy, and convenience are a must, a Database Management System (DBMS) is the backbone of any business process. It's crucial for businesses to stay competitive and organized. A DBMS helps by providing a centralized, secure, and efficient way to store and manage data, allowing businesses to operate faster and make better decisions.

For this project, it allows all the data, like customer info, orders, payments, and reports to be stored in one place and accessed easily when needed. Especially in a fast-paced environment like a food ordering system, it's important that data updates in real time, and a DBMS makes that possible.

One of the best parts is how it helps reduce errors and makes sure the data is consistent, especially when different users (like admins, riders, and customers) are using the system at the same time. Also, using more Advanced DBMS features like stored procedures, triggers, and events made it easier to automate some parts of the system. These helped avoid writing repetitive code and made managing data much smoother. Overall, the DBMS played a huge role in making the system run efficiently and helping the business work better.

- **Challenges and Learnings**

Challenges:

- Figuring out how to handle different user roles (Admin, Rider, Customer) with their own features was a bit overwhelming at first.
- It took some trial and error to get the order statuses to sync correctly across all dashboards.
- Validating things like card payments, pickup schedules, and GCash uploads turned out to be trickier than expected.
- As a beginner, learning how to create and use triggers really took some practice.
- MySQL would sometimes crash in XAMPP, and I had to reinstall it more than once.
- NetBeans also ran into memory issues, so I had to manually increase its memory just to keep things running smoothly.

Learnings:

- Planning the database and making the ERD first really helped understand what tables and relationships were needed.
- Using clear names and normalizing the database made everything easier to manage later on.
- Creating SQL views early during development helped testing things better and made it easier to connect with the UI.

College of Informatics and Computing Sciences

- UI and UX really enhances the system, next time, adding things like dark mode, cleaner layouts, and better responsiveness is recommended.
- Adding tools like Google Maps would help make address input more accurate.
- Better security, like email verification and stronger password handling.

- **SQL Query Statement used**

Tables:

-- Stores all registered users (admin, rider, customer) with their login info and roles

```
CREATE TABLE USERS (  
  user_id INT(11) NOT NULL AUTO_INCREMENT PRIMARY KEY,
